Présentation

Activité détaillée

Eolink is an engineering company fully dedicated to the development of an innovative and integrated floating wind turbine. Founded in 2015 in France, the company has patented a configuration that will make floating wind energy more accessible. Based on a highly qualified team of 15 engineers and 2 business developers, Eolink focuses on experimental milestones to demonstrate its advantages.

At Eolink, we believe that offshore wind energy presents a sustainable opportunity. We are developing a unique floating solution, making it possible to produce clean and local energy, in a massive and economical way.

The advantage of the Eolink concept are :

- A 30% lighter structure thanks to a better distribution of forces,
- 10% additional energy thanks to a greater distance between blades and masts,
- On-site deployment facilitated by an unprecedented towing speed and a quick connection system,
- Easy and automatable industrialization similar to the modular construction of merchant ships,
